

Green Spirit

Italian Ryegrass

Italian ryegrass provides excellent quality forage for up to two years, depending on climate and available moisture. Due to its quick regrowth, very early development in spring, and a prolonged growing period in the fall, this species usually has greater overall productivity than other cool season grasses. When planted in the spring, Italian ryegrass will not go to seed in the first season. This results in high quality forage production without the low quality stems and seed heads during the first year.

Italian Ryegrass Blend

- Excellent Forage Quality
- High Dry Matter Production
- Great Component in Your TMR

Use this perfect combination of both diploid and tetraploid Italian ryegrasses as a rotation crop for fall planting. When planted in the spring, seed heads do not emerge during the first year. Green Spirit is a perfect high-quality emergency feed. Compared to small grains, Green Spirit offers higher yields of higher quality forage for a lower seed cost.
